

What is Claimed;

5 **32.(NEW)** A data carrier reader containing the means within itself to interpret data as read from a data carrier, then activate if not already active a communication link program in an attached computing device to enable the transferring of data indicative of server address location data to said communication link program thereby forming a communication link to said
10 server address location and further data after said communication link is established.

33.(NEW) A system for transferring or requesting data via a communication network according to claim 32 in that said reader includes
15 the means to coordinate the transfer of any additional data from a data carrier to a server address location after a communication link to said server location has been established when requested.

34.(NEW) A system for transferring or requesting data via a
20 communication network according to claim 33 in that said system includes the means for an Internet server location being arranged to open a specific account at said server location and transmit or not data following receipt of individual account reference data transmitted to said server location.

25 **35.(NEW)** A system for transferring or requesting data via a communication network according to claim 34 in that an account server is

arranged to store individual account data, wherein said server is arranged to update said individual account data after verification when activated.

36.(NEW) A system for transferring or requesting data via a communication network according to claim 35 in that an account server is arranged to store individual account data, wherein said server is arranged to update said individual account data in the background by monitoring the continued access to a remote location when linked through said generated communication link to said individual account at said server.

37.(NEW) A system for transferring or requesting data via a communication network according to claims 36 in that the location address and further data recorded on a data carrier predetermines the actions of the data carrier reader for activating a communication link program utilizing said address data read from said carrier data and the transferring of any additional data.

38.(NEW) A system for transferring or requesting data via a communication network according to claim 37 in that said reader further comprising the means of determining whether server location address data also includes direct communication link data, wherein if said data also includes a direct communication link address data, said reading means being arranged to select then activate the correct communication path program in said computing device to enable the transfer of information to and from said address location via said communication link.

27

39.(NEW) A system for transferring or requesting data via a communication network according to claim and 38 in that said computing device contains said reader that is inseparable or built within itself.

5 40.(NEW) A system for transferring or requesting data via a communication network according to claim 39 in that said reader interprets data carrier data that may be constituted by magnetic, electrical, optical, cable, CD ROM, embedded, radio signal, source or object code, barcode, integrated circuit, smart card or entity being adapted for performing, or for
10 use in the performance of the relevant processes.

41.(NEW) A system for transferring or requesting data via a communication network according to claim 40 in that said data carrier utilizes radio signals to form a wireless connection to said data reading
15 means.

42.(NEW) A system for transferring or requesting data via a communication network in that a data carrier relating to an individual account at a server location is accessed directly in the background by
20 forming a connection utilizing individual account data, account server address data and or telephone reference data.
